

API (Application Programming Interface)

What is an API?

An API or Application Programming Interface, is a set of rules or protocols that enables software applications to communicate with each other to exchange data, features and functionality.

(Functionality in software engineering refers to the specific features, capabilities, and behaviors a software system provides to meet user needs and business requirements)

API simply accelerate application and software development by enabling developers to integrate data, services and capabilities from other applications, instead of developing them from scratch.

APIs are predefined interfaces that share only the necessary data and functions for specific queries, Servers do not have to fully expose the data.

How do APIs Work?

API communicate in terms of a request and response between a client and server. The application submitting the request is the client, and the server provides the response.
